

Utils

The utils package contains reusable helper modules that complement agent features without being tied to a specific execution layer such as core, NLP, platforms, or database.

Web Crawl

The web_crawl utility provides a simple breadth-first crawler to collect web pages from a given domain. It can return either raw HTML or Markdown content, which is useful for grounding LLM prompts with website knowledge.

Basic usage

```
from baf.utils.web_crawl import crawl_website
```

```
pages = crawl_website(  
    initial_url="https://besser-pearl.org/",  
    max_depth=2,  
    max_pages=20,  
    format="markdown",  
    base_url_prefix="https://besser-pearl.org/",  
)
```

pages is a dict[str, str]: {url: content}

How it works

URLs are normalized with `baf.utils.web_crawl.normalize_url()`.

Crawling is breadth-first up to `max_depth` and `max_pages`.

Links are restricted to the same domain as `initial_url`.

If `base_url_prefix` is provided, only matching URLs are included.
